1. Introduction

- The RideShare Website is a smart online platform designed to make ride booking easier, faster, and more convenient for users.
- The system allows users to register, log in, book rides, and complete payments through a simple and user-friendly interface.
- Different modules such as Registration, Login, User Dashboard, Ride Booking, Payment System, and Admin Dashboard were successfully implemented.
- The website also ensures better communication between riders and the system through automated booking and confirmation features.

2. Review of existing work

Ride-sharing services are becoming increasingly popular in Bangladesh, particularly among young people who use app-based platforms like Uber and Pathao. However, the sector faces significant challenges including high costs compared to public transport and security concerns with contact-based services [1]. The project successfully created a functional platform that connects passengers with nearby drivers, enabling ride booking, real-time tracking, and fare calculation. The platform can be enhanced with features like in-app payments, intelligent route optimization, push notifications, and cloud deployment [2]. Contributes to economy by providing job opportunities, promoting sharing economy practices, and enabling safe travel options and delivered a functional ridesharing platform with registration modules, route selection, ride booking, driver dashboard, and payment receiving capabilities [3]. The study excluded grey literature and non-English publications, considered only 29 platforms which may not represent all informal ride-sharing services operating in local languages [4]. The study did not consider the impact of moderators like gender, age, cities, educational background, prior rideshare experience. It suggests that the government should implement proper regulations and safety measures to make contact-based ride-sharing more secure and affordable [5].

3. Critical Analysis and Problem Statement

The RideShare dashboard provides a clean, modern interface with essential metrics for monitoring a ride-sharing platform. The design focuses on key performance indicators including Active Rides, Total Drivers, and Today's Revenue, complemented by visual charts for Rides Per Hour and Revenue Trends. The absence of real-time data granularity, geographic visualization, and driver performance metrics limits its effectiveness for comprehensive platform management. The interface focuses heavily on aggregate numbers without providing actionable insights into demand patterns, driver utilization, or service quality indicators essential for scaling a ride-sharing business.

Problem Statement

1. Users face difficulties in booking rides quickly and conveniently.
2. Secure user registration and login are often lacking.
3. Users need secure online payment and transaction confirmation.
4. Users lack real-time updates on ride requests and booking status.

5. Objectives

1. To develop a user-friendly RideShare website for easy and fast ride booking.
2. To implement a secure user registration and login system for authentication.
3. To integrate an online payment system with secure transaction confirmation.
4. To enable real-time ride request tracking and booking status updates.

6. Project Explanation

RideShare is a web-based platform designed to make ride booking easy, fast, and convenient. It allows users to register and securely log in to the system. Users can select pickup and drop-off locations and book their desired rides. The dashboard helps users manage their ride requests and booking information. The system provides booking status updates for better communication with users. An online payment system enables secure transactions and booking confirmation. Overall, the platform provides a simple, reliable, and user-friendly ride-sharing solution.

7. Expected Outcome

1. Provides location-based ride tracking.
2. Supports separate rider, driver and admin functionality.
3. Provides an organized ride-booking platform.

8. Milestone

Activity	M1	M2	M3	M4	M5	M6
Requirement Analysis & Planning						
Core Development						
Real-Time Features & Matching Engine						
Admin Dashboard & Analytics						
Testing & Optimization						
Deployment & Launch						
Final Presentation and Submission						

Table 7.1: Timeline of project

9. Budget

Description	Unit Cost (BDT)	Estimated Time	Total Cost (BDT)
Frontend development	2,000	1 week	2,000
Backend & Admin panel	2,500	1-4 week	2,500
Integration & Testing	3,500	3-5 week	3,500
Deployment & Launch	1,000	5-6 week	1,000
Total			9,000

In Word: Nine thousand only.

10. Conclusion

In conclusion, The RideShare Website successfully provides a smart, user-friendly, and efficient platform for online ride booking. The implemented modules simplify essential activities such as user authentication, ride booking, payment, and administration. The system also improves the overall interaction between riders and the platform through automated booking and confirmation features.
